

NO₃ — indirect (canopy-N proxy)

| ρ |max (clean) = 0.43

Farm-LOFO ρ = 0.21

between-field ICC = 0.45

tiers: 44 generalise (12 robust) / 9 zonal / 123 unstable / 336 weak

Behaviour: Indirect — spring canopy proxies (SAVI/NDRE) reflect biomass/management, not direct nitrate sensing; out-of-farm signal is weak ($\rho=0.22$).
