

NO₃ — indirect (canopy-N proxy)

$|\rho|_{\max}(\text{clean}) = 0.43$ Farm-LOFO $\rho = 0.21$ field-in-farm ICC = 0.47 tiers: 44 generalise (12 robust) / 9 zonal / 123 unstable / 336 weak

Behaviour: Indirect — spring canopy proxies (SAVI/NDRE) reflect biomass/management, not direct nitrate sensing; out-of-farm signal is weak ($\rho=0.22$).
